Possible report formats

How an agent reliability / QA service delivers evaluation results — formats by audience, a consulting-style report template with a worked sample, and whether to link to Arize or send our own report.
October 2026

> **Recommendation in one line:** the deliverable is **our own branded report**. Phoenix/Arize trace links are attached as **evidence** for engineers, never as the report itself.

Contents

1. Formats by audience
2. Report structure at a glance
3. Sample report (worked example)
4. Scoring method and severity scale
5. Our report or Arize links?
6. Delivery cadence and package

1. Formats by audience

Audience	What they need	Format	Length
CEO / founders	Is it safe to ship? What is the risk?	1-page executive summary (PDF or slide)	1 page
Product / engineering leads	What is broken, how bad, what to fix first	Full evaluation report (PDF)	8–15 pages
Engineers	Exact failing cases to reproduce	Spreadsheet/CSV + trace links	As long as needed
Retainer clients	Is it getting better or worse?	Live dashboard + monthly PDF	Ongoing
Everyone	Shared understanding	30-min readout call walking through the report	30 min

2. Report structure at a glance

#	Section	Purpose	Pages
1	Cover	Client, agent, version, dates, test-set version	1
2	Executive summary	Score, verdict, top 3 risks, top 3 fixes, trend	1
3	Scope and method	What was tested, how, access level	1
4	Scorecard	Every dimension vs target	1
5	Findings	One card per issue with evidence and fix	3–8
6	Recommendations roadmap	Now / next / later with effort	1
7	Appendix	Test set, scoring rubric, raw data, trace links	1–3

3. Sample report (worked example)

All numbers below are illustrative, using a pet-care booking assistant as the example.

SECTION 1 — COVER

Agent Reliability Evaluation

Client: Example Pet Care Ltd · **Agent:** "Petto" booking assistant v2.3
Test window: 1–10 Oct 2026 · **Test set:** v1.2, 220 conversations (EN/DE)
Access level: Tier 2 — traced on staging · **Prepared by:** [Your company]

SECTION 2 — EXECUTIVE SUMMARY

74/100

Verdict: Ship with fixes
Up from 66 last cycle (+8)

Top risks

1. Books appointments without explicit confirmation in 3% of cases.
2. Answers "find a vet" questions without searching in 8% of cases.
3. p95 reply time 6.8 s, above the 5 s target.

Top fixes: (1) hard confirmation rule in the booking tool; (2) prompt rule forcing a search for provider questions; (3) remove the unused second model call, saving ~1.5 s.

SECTION 3 — SCOPE AND METHOD

- **Covered:** search, availability, booking, cancellation, appointment lookup; English and German; 20 adversarial prompts.
- **Not covered:** payments, voice input, load above 20 concurrent users.
- **Scoring:** rule checks (tool chosen, arguments, errors), model-as-judge for grounding and helpfulness, 15% human review for calibration.
- **Access:** traced on staging via a client-reviewed tracing change; no production data used.

SECTION 4 — SCORECARD

Dimension	Result	Target	Status	Trend
Task success	84%	90%	Below	↑ 6
Correct tool selected	89%	95%	Below	↑ 4
Correct tool arguments	92%	95%	Below	→
Grounded (no made-up facts)	95%	98%	Below	↑ 2
Safety and correct refusals	99%	99%	Met	→
Correct language	99.5%	99%	Met	↑ 1
p95 latency	6.8 s	≤ 5 s	Below	↓ 0.4 s
Cost per conversation	$0.004	≤ $0.006	Met	→
Consistency (same question, 3 runs)	91%	90%	Met	new

SECTION 5 — FINDING CARD (ONE PER ISSUE)

F-01	**Booking made without explicit confirmation** Critical
What happens	User says "ok maybe Tuesday?" and the agent books immediately.
Frequency	7 of 220 conversations (3.2%)
Impact	Unwanted appointments, no-shows, support load, trust.
Evidence	Transcript excerpt + trace link T-0412 (tool `bookAppointment` called with `confirmation: "ok maybe"`).
Root cause	The tool treats any non-empty confirmation text as "yes".
Recommended fix	Accept only clear yes/no; otherwise ask again. Add 10 regression tests.
Effort / owner	~0.5 day · Backend

F-02	**Provider questions answered without searching** High
What happens	"Any vets open Sunday in Munich?" answered from general knowledge; no search tool called.
Frequency	18 of 220 (8.2%)
Root cause	Prompt does not require a tool call for provider questions.
Recommended fix	Add rule + few-shot examples; monitor zero-tool rate.
Effort / owner	~1 day · AI/prompt

SECTION 6 — RECOMMENDATIONS ROADMAP

When	Action	Fixes	Effort	Expected gain
Now (this sprint)	Strict booking confirmation	F-01	0.5 d	Removes critical risk
Now	Force search for provider questions	F-02	1 d	Task success +5 pts
Next	Drop the unused second model call	F-04	0.5 d	p95 −1.5 s
Later	Regression suite on every release	All	3 d	Prevents repeats

SECTION 7 — APPENDIX

- A. Test set (220 conversations, categories, expected tool per case)
- B. Scoring rubric and judge prompts
- C. Full results CSV (one row per conversation)
- D. Trace links for every failing case
- E. Environment: model, version, date, settings

4. Scoring method and severity scale

How each dimension is scored

Dimension	Method	Needs code access?
Task success	Expected outcome per test case; rule or judge	No
Correct tool / arguments	Compare trace to expected tool and fields	Yes
Grounded	Judge model compares answer to tool output	Best with yes
Safety	Adversarial prompts; judge + human review	No
Latency / cost	Measured per conversation	Cost: yes
Consistency	Same input run 3 times; compare	No

Overall score

Weighted average of dimensions, weights agreed with the client up front (e.g. task success 30%, tool accuracy 20%, grounding 20%, safety 15%, latency 10%, cost 5%). Keep weights fixed between cycles so trends are comparable.

Severity scale

Level	Meaning	Expected response
Critical	Wrong action with real consequences, data leak, harmful advice	Fix before release
High	Task fails often or misleads users	Fix this sprint
Medium	Poor experience, works eventually	Plan in roadmap
Low	Cosmetic, tone, formatting	Backlog

Verdict

Verdict	Rule of thumb
Ready	No critical/high findings, all key targets met
Ship with fixes	No unresolved critical; highs have a dated plan
Not ready	Any unresolved critical finding

5. Our report or Arize links?

	Our own report	Links to Arize / Phoenix
Readable by executives	Yes	No — raw tables and spans
Contains insight (why, what to do)	Yes — this is what is paid for	No — data only
Our brand and perceived value	Strong	Makes the tool look like the product
Works without tool access	Yes	Needs logins; links can break or expire
Data-residency friendly	Yes — only excerpts	Depends where Phoenix is hosted
Lets engineers dig into detail	Partly	Yes
Comparable over time	Yes — fixed scorecard	Hard

> **Do both, in this order:**
>
> 1. A branded PDF report as the deliverable.
> 2. Each finding links to the exact trace in the client's Phoenix as evidence.
> 3. A CSV of all results for engineers.
> 4. Optional: read-only dashboard access for retainer clients.
>
> The tool is how we do the work; the report is what the client buys.

> If Phoenix runs on **our** servers, the client's chat data sits with us. Prefer the client's own Phoenix and link to it, or include only redacted excerpts in the report.

6. Delivery cadence and package

Engagement	Delivered	Cadence
One-off audit	Executive summary, full report, CSV, readout call	Once, end of engagement
Diagnose	Above + root causes, trace links, fix verification re-run	Report + re-test after fixes
Monitor (retainer)	Live dashboard, monthly PDF, release regression results, alerts	Monthly + every release

Delivery checklist

- Every finding has frequency, evidence, root cause (or "needs tracing"), fix, effort.
- Numbers match the CSV exactly.
- Personal data removed from excerpts.
- Test-set version and agent version stated, so the next cycle is comparable.
- Readout call booked within a week of delivery.
